

Design Suitability	<p>Insufficient Consideration at design stage.</p> <p>Poor structural design e.g.: long, slender beams</p> <p>Incorrect loading calculations</p> <p>Inadequate provision for movement expansion joints</p> <p>Incorrect use of reinforcement e.g.: wrong size bars or overall design</p>
Mix Design	<p>Incorrect cement specified</p> <p>Wrong type or grading of aggregates</p> <p>Incorrect water/cement ratios</p>
Workmanship	<p>Failure to observe design details</p> <p>Incorrect batching and mixing / inconsistent mixing</p> <p>Incorrect water/cement ratio</p> <p>Inadequate compaction/vibration</p> <p>Poor shuttering or formwork</p> <p>Incorrect use of reinforcement</p> <p>Allowing corrosion promoting chemicals into the mixing/placement process</p> <p>Inadequate cover to steel reinforcement</p> <p>Insufficient curing</p>
Environmental	<p>Excessive mechanical stresses – overloading/subsidence/unanticipated movement</p> <p>Excessive temperature changes during placement and during design life</p> <p>Frost attack – freeze/thaw action causing surface damage</p> <p>Physical damage such as collision or impact damage, explosion abrasive wear</p> <p>Damage from plants and micro organisms, algae, lichen etc</p> <p>Chemical attack from acids, chemical spillages, acid rain, seawater (salts)</p> <p>Carbonation attack</p> <p>Chloride attack</p> <p>Alkali Silica Reaction (ASR), Electric fields (causing electrochemical reaction)</p> <p>Shrinkage (plastic or drying shrinkage) / Reactive ironstone etc.</p>
